

## CMX90B702 Low Current/Noise Gain Block 23 – 29.5 GHz

### Description

The CMX90B702 is a low-current 50 Ω gain block suitable for a wide variety of wireless applications covering 23 – 29.5 GHz.

CMX90B702 is highly integrated to minimize external component count and board area. RF ports are matched on-chip to 50 Ω with an output DC-blocking capacitor. An active bias circuit helps maintain performance over a wide temperature range and supply voltage of 3 – 5 V.

The device is an easy-to-use gain block with fast enable circuit and dual-bias mode for system optimization, selecting bias of 10 mA or 15 mA.

CMX90B702 is fabricated using a GaAs pHEMT process to provide optimum gain, linearity, and noise together with low DC power consumption.

A footprint-compatible variant, CMX90B701, is available for applications covering 17 – 23 GHz.

### Applications

- 5G mmWave Infrastructure
- Satcom (K and Ka band)
- Microwave Backhaul
- Fixed Wireless Access (FWA)
- 24 GHz ISM band

3x3mm VQFN-16 Package

### Product Features

- Frequency range 23 – 29.5 GHz
- Small signal gain 17.5 dB
- Single positive DC supply 3 – 5 V
- Low power consumption 40 mW
- Output P1dB +5 dBm @ 26 GHz
- Output IP3 +15 dBm @ 26 GHz
- Noise figure 4 dB
- Dual-bias mode (low/high setting)
- 105 °C operating temperature

### Block Diagram

### Ordering Information

Part Number	Description
CMX90B702QF-R705	7" Reel with 500 pieces
CMX90B702QF-R710	7" Reel with 1,000 pieces
EV90B702	Evaluation board

## Absolute Maximum Ratings

Parameter	Rating
RF Input Power	+6dBm
Device Voltage (Vd, Ven)	+5.5V
Case Temperature (Tc)	-40 to +85 °C (Vd ≤ 5 V, high or low mode) -40 to +105 °C (Vd ≤ 4V, high mode) -40 to +105 °C (Vd ≤ 5V, low mode)
Junction Temperature (Tjmax)	165 °C (Process MTTF = 10 <sup>7</sup> hours)
Storage Temperature	-40 to +125 °C
ESD Sensitivity	HBM 250V (Class 1A), CDM 500V (Class C2a)
MSL Level	Level 3

Exceeding the maximum ratings may result in damage or reduced device reliability.

## Thermal Characteristics

Parameter	Rating
Thermal Resistance (Rjc)	719 °C/W (Tc = 85 °C) 753 °C/W (Tc = 105 °C)

Thermal resistance is junction-to-case, where case refers to the exposed die pad on the backside which is in contact with the board.

## Recommended Operating Conditions

Parameter	Min	Typ	Max	Units
Operating Frequency Range	23		29.5	GHz
Case Temperature (Tc) Vd ≤ 5 V, high or low mode	-40		+85	°C
Case Temperature (Tc) Vd ≤ 4 V, high mode	-40		+105	°C
Vd ≤ 5 V, low mode				
Device Voltage (Vd)	3		5	V
Enable Voltage (Ven)	0		5	V

The device will be tested under certain conditions, but performance is not guaranteed over the full range of recommended operating conditions.

## ESD Caution

CMX90B702 incorporates ESD protection circuitry however ESD precautions are strongly recommended for handling and assembly. Ensure that devices are protected from ESD in antistatic bags or carriers when being transported. Personal grounding is to be worn at all times when handling these devices.

## RoHS Compliance

All devices supplied by CML Microcircuits are compliant with RoHS directive (2011/65/EU), containing less than the permitted levels of hazardous substances.

## Electrical Specification

Results taken on EV90B702 EVB, where track losses have been de-embedded using the calibration line on the EV90B702 evaluation board.

$Z_0 = 50 \Omega$ ,  $V_d = +4 \text{ V}$ ,  $V_{en} = +4 \text{ V}$ ,  $V_{mode} = \text{Low Current}$ ,  $T_a = +25 \text{ }^\circ\text{C}$  (unless otherwise noted)

Parameter	Conditions	Min	Typ	Max	Units
<b>Frequency</b>		23		29.5	GHz
<b>Small Signal Gain</b>	23 GHz		17.5		dB
<b>Small Signal Gain</b>	26 GHz		17.5		dB
<b>Small Signal Gain</b>	29.5 GHz		17		dB
<b>Gain Flatness</b>	23 GHz to 29.53 GHz		+/- 1		dB
<b>Reverse Isolation</b>	23 GHz to 29.5 GHz		>30		dB
<b>P1dB</b>	At 26 GHz		5		dBm
<b>OIP3</b>	Two-tone test $\Delta f = 100 \text{ MHz}$ , at 26 GHz, Pout/Tone = -7dBm	-	15	-	dBm
<b>Noise Figure</b>	26GHz		4		dB
<b>Input Return Loss</b>	23 GHz to 29.5 GHz		6		dB
<b>Output Return Loss</b>	23 GHz to 29.5 GHz		8		dB
<b>Device Current (Id)</b>			10		mA
<b>Ven (Logic 1 = Enabled)</b>	Amplifier normal operation	1.8		5	V
<b>Ven (Logic 0 = Standby)</b>	Amplifier in standby mode	0		0.2	V
<b>Id</b>	$V_d = 5 \text{ V}$ , $V_{en} = 0 \text{ V}$		1.5		$\mu\text{A}$
<b>S21</b>	$V_{en} = 0 \text{ to } 0.2 \text{ V}$		<-20		dB
<b>Ven Current (Ien)</b>	$V_{en} = 4 \text{ V}$		0.37		mA
<b>Turn-On Time</b> <b>RFout: 10 % to 90 %</b>	$R_{Fin} = -10 \text{ dBm}$ , 26 GHz		0.6		$\mu\text{s}$
<b>Turn-Off Time</b> <b>RFout: 90 % to 10 %</b>	$R_{Fin} = -10 \text{ dBm}$ , 26 GHz		0.9		$\mu\text{s}$

## Pin Assignments

Pin	Name	Description
1	NC	Connect to GND
2	GND	Connect to GND
3	RFin	RF input. Internally matched to 50 Ω with DC path to ground to provide enhanced ESD robustness.
4	GND	Connect to GND
5	NC	Connect to GND
6	NC	Connect to GND
7	NC	Connect to GND
8	NC	Connect to GND
9	GND	Connect to GND
10	RFout	RF output. Internally matched to 50 Ω with integrated DC-blocking capacitor.
11	GND	Connect to GND
12	NC	Connect to GND
13	NC	Connect to GND
14	Vd	Voltage supply to amplifier
15	Mode	Mode pin to select current mode – GND = Low Current and O/C = High Current
16	Ven	Amplifier enable input
Die pad	GND	DC and RF ground. Exposed die pad must be connected to GND.

### Notes

CML recommends that all no connect (NC) pins are connected to ground.  
 The bottom exposed die pad must be connected to the ground plane on the board.

## Typical Performance

The following plots show typical performance characteristics of CMX90B702 measured on the evaluation board (Part Number EV90B702). Board losses have been de-embedded from the measurement results using the through line included on the EV90B702.

**RF typical performance:  $V_d = V_{en} = 4.0V$ ,  $T_a = 25\text{ }^\circ\text{C}$ ,  $Z_0 = 50\text{ }\Omega$**

**Figure 1: Gain  $V_d = V_{en} = 4.0V$**

D1	DNF	SOD-523F	
J6	N/A	0.1" Header	High / Low Current selection

### Notes

- DNF = Do not fit component

### PCB Layout

Careful layout of the printed circuit board (PCB) is essential for optimum RF and thermal performance. The recommended layout, including ground via pattern underneath the device, may be taken from the evaluation board (Part Number EV90B702).

The PCB consists of a top layer of MT40 backed by 2 layers of FR-4 with a total thickness of 1.632 mm (Figure 63) and the EV90B702 PCB (Figure 64) is 20 mm x 45 mm. The coplanar RF transmission lines have a width of 0.33 mm with a gap of 0.14 mm to ground either side. The through line length has been reduced by 3mm to account for the length of the device.

Figure 63: EV90B702 Layer Stack

Figure 64: EV90B702 PCB Top Layer View

**Thermal Design**

The primary RF/DC ground and thermal path is via the exposed die pad on the backside of the package, which must be connected to the PCB ground plane. An array of plated through-hole vias directly underneath the die pad area is

essential to conduct heat away and minimise ground inductance. A typical solution will have 9 grounding vias connecting the top layer to the bottom layer, with inner diameter of 0.2 mm (and 0.025 mm plating) on a 0.55 mm grid pattern. The vias do not need to be filled. The PCB layout should provide a thermal radiator appropriate for the intended operation, adding as much copper to inner and outer layers as possible to avoid excessive junction temperature.

Device junction temperature ( $T_j$ ) can be calculated using  $T_j = T_c + (P_{diss} \times R_{jc})$  where  $P_{diss} = P_{dc} + P_{in} - P_{out}$  and  $T_c$  is the case temperature on the backside of the package (die pad) in contact with the PCB.

### Ven Input

The device is enabled by applying a voltage between 1.8 V and 5.0 V to pin 16 (Ven). The resulting  $I_d$  taken by the device is relatively independent of the Ven voltage applied. If the enable feature is not required, the Ven pin can be connected to the same voltage as  $V_d$ .

The device can be placed into standby mode when not in use by setting Ven low (<0.2V) to disable all circuitry.

If lower  $I_{en}$  and  $I_d$  leakage current and/or if the highest forward isolation is needed in standby mode, a diode can be used in series with the Ven pin to increase the switch-on threshold of the device. This can be particularly important at elevated temperatures. Some suggested diodes in suitable packages (SOD-523F) for the evaluation board are:

- 1N914BWT-D PN fast switching diode
- BAT43XV2-D Schottky diode

### Evaluation Board & Bias Procedure

In general, sequencing of the  $V_d$  and Ven supplies is not necessary however applying  $V_d$  before or simultaneously with Ven is recommended.

The separate through line can be used to measure the evaluation board and connector losses. These results can then be used to de-embed the device performance from evaluation board measurements.

Figure 65: Insertion Loss – through line

Figure 66: Return Loss – through line

### Current Mode Setting

The mode pin (pin 15) is used to set the current taken by the CMX90B702. Low current mode (~10 mA) is selected by fitting the jumper (J6) on the evaluation board, which connects the mode pin to ground. High current mode (~15 mA) is selected by not fitting the jumper, which leaves the mode pin open-circuit.

## Package Outline

16-lead 3x3mm VQFN Package (QF)

## Package Marking

Pin 1 indicator (dot) and 3 rows of text for device identification.

Line 1: CMX90 S $\mu$ RF series

Line 2: 4-character part code

Line 3: Batch code
