

# **DE9941A** User Manual

UM9941A/2 February 2022

#### **USER MANUAL**

Advance Information

#### Features

- Demonstration of SDR wireless data modem supporting multiple bit rates and modulation schemes
- Direct Conversion Receiver (CMX994E) and Cartesian Feedback Loop Transmitter (CMX998)
- 1W Transmitter Operation
- Designed to meet EN 302 561 / EN 300 113

- Provides a demonstration platform for the CMX7364 Multi-mode High Performance Wireless Data Modem
- On-board PLL and VCO for 350 to 400MHz and 400 to 470MHz Operation
- On-board STM32 ARM microcontroller with bootloader and USB interface
- Small size 87mm x 55mm

#### 1 **Brief Description**

The DE9941A is a small demonstration platform for the CMX994E Direct Conversion Receiver, the CMX998 Cartesian Loop Transmitter and the CMX7364 Multi-mode High Performance Wireless Data Modem. The small form factor of the demonstration/evaluation platform is possible due to the compact nature of the CML IC solutions. The DE9941A can be used to demonstrate Tx and Rx performance with multi-level QAM, FSK and GMSK type modulation. Together with the on-board ARM host controller, a full transceiver can be demonstrated using a Function Image<sup>™</sup> and control scripts.

The DE9941A provides a Fractional-N PLL and VCO to provide local oscillator signals for the CMX994E and CMX998. The on-board ARM microcontroller, together with the control scripts, gives the user the ability to program the RF synthesiser to the correct operating frequencies. The design also includes a 1W power amplifier, harmonic filter, and Tx/Rx switch. The RF performance is designed to be compliant with EN 302 561 / EN 300 113 and all the circuits are provided with power-down capability to allow standby functionality. The design is aimed to be low cost, with a minimum number of component types/values.

There are two variants of the DE9941A available: the DE9941A-375 covers 350 to 400MHz and the DE9941A-435 covers 400 to 470MHz. Throughout this document "DE9941A" will refer to both variants unless otherwise stated.

# 3 Preliminary Information

The DE9941A provides a RF platform for demonstration and evaluation of the CMX7364 Multi-mode High Performance Wireless Data Modem, with the use of the CMX994E Direct Conversion Receiver and the CMX998 Cartesian Feedback Loop Transmitter. A 1W power amplifier has been included plus Fractional-N PLL with integral VCO for stand-alone operation.

The DE9941A is designed to be used with the ES9941A software package running on a PC which provides controller functionality via the USB interface. This software allows scripts to be used to control the CMX7364. All RF circuits are controlled via the CMX7364 C-BUS interface. Various scripts are available for use with the DE9941A (see section 7.3.1). Alternatively, users may implement their own host controller solution on the ARM (STM32) microcontroller.

## 3.1 Laboratory Equipment

The following laboratory equipment is needed to use this demonstration/evaluation kit:

- Power Supply
- Spectrum Analyser
- RF Signal Generator
- Oscilloscope
- Personal Computer + USB interface

For more detailed design or investigation work, additional RF test equipment may be required.

#### 3.1.1 Power Supply

The supply input voltage to the PCB is nominally 4.5V (3.6V to 4.8V acceptable). On-board regulators are provided to generate all voltage rails used on the PCB (3.3V). The 4.5V supply should be rated at 2A.

**NOTE:** Care should be exercised with the supplies as they are not protected for reverse polarity. The 4.5V supply directly feeds the power amplifier and it should not exceed 5.0V for nominal operating limits.

## 3.2 Handling Precautions

Like most evaluation kits, this product is designed for use in office and laboratory environments. The following practices will help ensure its proper operation.

#### 3.2.1 SSD Devices

This product uses low-power CMOS circuits that can be damaged by electrostatic discharge. Partiallydamaged circuits can function erroneously, leading to misleading results. Observe ESD precautions at all times when handling this product.

# 3.2.2 Contents - Unpacking

Please ensure that you have received all of the items on the separate information sheet (EK9941A-375) and notify CML within seven working days if the delivery is incomplete.

#### 3.3 Approvals

This product is not approved to any EMC or other regulatory standard. Users are advised to observe local statutory requirements, which may apply to this product and the radio frequency signals that may emanate from it.

# 4 Quick Start

This section provides instructions for users who wish to experiment immediately with this Evaluation Kit. A more complete description of the kit and its uses appears later in this document. The user should read the appropriate CMX7364, CMX994E and CMX998 Datasheets before using the DE9941A board.

This Quick Start configuration assumes that the user has installed the ES9941A Windows GUI software which provides the interface between DE9941A and a controlling PC. The script language used is the same as the PE0003. The PE0003 Script Language Reference document is available from the Design Resources area of the PE0003 product page on the CML website. The DE9941A-SCRIPT\_FXX.XX.bin firmware will need to be loaded by ES9941A Windows GUI software. This only needs to be done once.

# 4.1 Setting-Up

The following procedure is recommended:

1. Connect the boards as shown in Figure 2. J7 should be connected to either an RF signal generator or spectrum analyser via a suitable  $50\Omega$  attenuator. If testing the transmitter, the RF output J7 should be connected to a suitable  $50\Omega$  load.

# THE USE OF AN EXTERNAL 50 $\Omega$ load is essential to prevent possible damage to the RF power amplifier stage.

- 2. Connect the PC to the DE9941A USB interface connector J4, note that this will apply power to board via the USB interface.
- 3. Apply power to the DE9941A, note that connecting the USB interface will apply power sufficient for Rx operation but not Tx operation. For Tx operation a power supply capable of 2A is required.
- 4. Install the ES9941A software when prompted.
- 5. The CMX7364 fitted to the DE9941A must be loaded with the required Function Image<sup>™</sup>. This can be done using the GUI. Programming of the RF PLL IC, the CMX994E and the CMX998 is via the GUI using a suitable script, for which examples are available (see section 7.3.1).

The board is now ready for operation.

Figure 2 Typical Evaluation Connections for DE9941A

#### 4.1.1 ES9941A Software and Driver Installation

When connecting the DE9941A for the first time the Windows 10 driver for the STM microcontroller should be automatically installed. If any problems are experienced the STM32 Virtual Com Port driver can be downloaded from the STM website. The GUI is available to download from the CML website.

The DE9914A comes with a pre-installed bootloader (DE9914A-BOOTLOADER\_F01.XX.XX.bin). The DE9941A-SCRIPT\_F02.XX.XX.bin firmware will need to be loaded into the DE9914A's flash memory by the ES9941A Windows GUI software. This only needs to be done once. The firmware is available to download from the CML website.

The script language is described in the PE0003 User Manual.

The bootloader firmware (DE9914A-BOOTLOADER\_F01.XX.XX.bin) can up be reloaded at any time using the JTAG port and any application that supports loading the firmware into the internal flash memory of an STM32F411VE (Cortex M4) processor. The firmware should be loaded starting at address 0x00000000. The firmware is available to download from the CML website.

#### © 2022 CML Microsystems Plc

# 4.2 Configuration

The CMX7364 must be loaded with a Function Image (FI) to initialise the device and determine the modulation type; FI-1.x supports GMSK/GFSK, FI-2.x supports multi-level FSK and FI-4.x supports 4/16/64-QAM. This User Manual focuses on FI-4.x primarily because this fully utilities the Tx functionality due to QAM being a non-constant envelope modulation. Support scripts have been provided to support FI-2.x and FI-4.x setups.

The following procedures allow the user to quickly set up the DE9941A for Rx or Tx operation.

#### 4.2.1 Tx Configuration

The following steps will configure the DE9941A-375 to transmit at 361.05MHz with a continuous 4-QAM PRBS modulated output using FI-4.x. Set the applied signals and run the scripts (see section 7.3.1 for details on the scripts) in the order shown in the following table. Note: Ensure J7 is connected to a Spectrum analyser via a suitable  $50\Omega$  attenuator for Tx testing.

Note: Setting the CML device registers requires the use of the DE9941A host connected as above. The CML datasheets give details of the registers and commands.

Script/Command	Setting	Note
DE9941A-	Script allows selection of:	At top of the script ensure: Baud rate 18 ksymbols/s, Rx_BW
375_QAM_Setup	Baud rate	= 25, modulation = 4 and Channel No = 4 (Operating
	Rx Bandwidth	Frequency is 361.05MHz).
	Mod size	
	Frequency	
DE9941A-	Script automatically performs a	User is prompted by script to check carrier null if required. If
375_QAM_setup	full DC Calibration on the	yes is selected the carrier null can be analysed. Note PA will
	CMX998	be enabled at this point. The Tx output level should be
		<-25dBm, the output should be nulled unmodulated carrier.
Write \$103A to	Apply Tx PRBS	The Tx output will now be at full output power (circa
modem control		+25dBm mean) continuously.
register (\$6B)		Note: due to limited heatsinking in the compact design it is
		advised to avoid leaving the Tx in this state for long periods
		of time.

# 4.2.2 Rx Configuration

The following steps will configure the DE9941A-375 to receive at 361.05MHz with a 1kHz tone IQ output. Set the applied signals and run the scripts (see section 7.3.1 for details on the scripts) as shown in the following table.

Note: Ensure that J7 is connected to a RF signal generator via a suitable  $50\Omega$  attenuator for Rx testing.

Setting the CML device registers requires the use of the DE9941A host connected as above. The CML datasheets give details of the registers and commands.

Signal/Script	Setting	Note
DE9941A- 375_QAM_setup	Script allows selection of: Baud rate Rx Bandwidth Mod size Frequency	At top of the script ensure: Baud rate 18 ksymbols/s, Rx_BW = 25, modulation = 4 and Channel No = 4 (Operating Frequency is 361.05MHz).
ANTENNA (J7)	361.051MHz	The input level here may be user defined: for an input signal of –60dBm at J7, the typical single-ended output level would be ~410mV p-p at TL2. The output should be a 1kHz sine and cosine wave on I and Q when the configuration in this table is completed.
RXIP (TL2)	RXI output	The differential I signal can be measured at TL2 and the differential Q signal can be measured at TL3.

# 4.3 Operation

Following the configuration procedures given in sections 4.1 and 4.2 the DE9941A-375 should be operating as a transmitter or receiver at 361.05MHz. Various evaluation tests can now be performed.

# 6 Circuit Schematics and Board Layouts

The DE9941A circuit schematic for each variant is available as separate high-resolution files, which can be downloaded from the CML website. The layout on each side of the pcb is shown in Figure 3 and Figure 4 below.

Figure 3 PCB Layout: top

Bottom Side

Figure 4 PCB Layout: bottom

# 7 Detailed Description

The DE9941A functionality includes:

- Nominal +4.5V Supply
- Direct Conversion Receiver
- Cartesian Feedback Loop Transmitter
- 1W Power Amplifier
- Fractional-N PLL with integrated VCO
- 38.4MHz VCTCXO
- Operation from 350 to 400MHz (DE9941A-375) or 400 to 470MHz (DE9941A-435)
- USB Interface that allows the card to be connected to a host PC and allows control of all device functions, to support initial test and customer evaluation.
- Capability to demonstrate the performance of the CMX7364 Multi-mode High Performance Wireless Data Modem, for example 4/16/64-QAM, 2/4FSK and GMSK.

In summary, the DE9941A allows the user to experiment and investigate all aspects of the CMX7364 device using an RF platform based around the CMX994E Direct Conversion Receiver and the CMX998 Cartesian Feedback Loop Transmitter. The DE9941A is designed to allow user modification to support detailed investigation of the user's various applications. The evaluation platform also includes additional circuits that allow the user to use the, DE9941A in standalone mode for example a fractional-N PLL (U5) with integrated VCO.

## 7.1 Hardware Description

#### 7.1.1 Harmonic Filter

L17, L18 and associated components form a low-loss low pass filter with taps centred at the  $2^{nd}$  and  $3^{rd}$  Tx harmonics. This filter is common to the transmitter and receiver paths and is connected between the Tx/Rx switch and the antenna connector J7.

## 7.1.2 Tx/Rx Switch

The Tx/Rx switch is a classic series-shunt switch using PIN diodes (D9 and D10) after a lumped quarter wave section. The diodes are activated in transmit via the GPIOC/TXD signal from the CMX7364. An additional diode is provided (at D10), in anti-parallel, to protect the LNA from extremely strong signals (e.g. a nearby transceiver). This branch of the switch then goes to the receiver input.

### 7.1.3 Coupler

The coupler is a lumped coupler formed around one of the low pass sections of the harmonic filter (L17). The signal is coupled from this low pass section to another low pass section (L14) via very low value capacitors (C166 & C167). The coupling factor is  $\sim$  31dB and the output of the coupler forms part of the feedback path to the CMX998 to create the Tx cartesian loop.

#### 7.1.4 Power Amplifier

The DE9941A includes a 1W Power Amplifier U2 (RF5110G) configured for the relevant band of operation and is capable of producing  $\sim$ +25dBm (mean) output power with 16-QAM modulation.

The CMX7364 RAMDAC (AUXDAC1) output is connected to the PA control line via a diode and transistor (D8 and TR9) to provide sufficient current to the PA control pins.

#### 7.1.5 Transmitter

The transmitter is based on the CMX998 Cartesian Feedback Loop Transmitter (CFBL) IC plus the PA and coupler which complete the loop. The up-converter, down-converter and LO Input are matched with broadband baluns. The LO is at two times the final operating frequency (DE9941A-375 is 700 to 800MHz and DE9941A-435 is 800 to 940MHz). The CMX998 IQ differential inputs are provided straight from the CMX7364 main DACs. The error amplifier is configured with a loop filter optimised for operation with the on-board power amplifier and for modulation bandwidths up to 50kHz.

The DCMEAS pin is connected to an AUXADC (2) on the CMX7364 to allow automatic DC calibration and the ability to control the PA from the CMX7364.

The CMX998 is controlled via the CMX7364 SPI-Thru port using chip select 1 (SSOUT1).

#### 7.1.6 Receiver

The receiver uses the CMX994E Direct Conversion Receiver which is capable of supporting a range of digital radio systems of both constant envelope and linear modulation types. The CMX994E integrated LNA has been utilised with the output of the LNA matched directly to the IQ down conversion mixer. The mixer converts the received signal to IQ baseband format, where C129 and C130 combine with on-chip components to remove off-channel signals. The signal is then amplified before further filtering to remove adjacent channel signals (C127 and C128). The nominal maximum bandwidth of the adjacent channel filters is 16kHz and this is scaled by a factor of 2 or 4 in the other filter bandwidth states. A final amplifier stage completes the receiver line-up, providing differential IQ outputs directly to the CMX7364 Main ADCs.

The overall receiver gain and noise figure for the default configuration is  $\sim$ 63.5dB and  $\sim$ 6dB respectively. The Rx input third-order intercept point is  $\sim$  -2 to -3dBm in normal mode and  $\sim$ +1 to +2dBm in enhanced mode.

The LO input is at two times the final operating frequency.

The CMX994E is controlled via the CMX7364 SPI-Thru port using chip select 1 (SSOUT1).

#### 7.1.7 Local Oscillator

The LO (Local Oscillator) for the Tx and the Rx is at two times the final operating frequency. The LMX2571 has been used to provide the LO, it integrates a Fractional N PLL, VCO, programmable dividers and output buffers. The LMX2571 also includes a partially integrated loop filter. The LMX2571 (U5) is controlled via the CMX7364 SPI Thru port and uses chip select 2 (SSOUT2).

If required, an external LO source (J6 PCB pad) can be used instead of the on-board VCO.

#### 7.1.8 Reference Oscillator

A 1.5ppm 38.4MHz VCTCXO (Golledge MP08120) is used as the reference for the Frac-N PLL and is divided by 2 for the CMX7364 (U6) and ARM (U10 - STM32).

#### 7.1.9 Power Supply

The input to the PCB is nominally 4.5V (3.5V to 4.8V is acceptable). On-board regulators are provided to generate voltage rails used on the DE9941A.

#### 7.1.10 Inductors

All inductors used in the RF sections of the design are manufactured by Coilcraft (<u>www.coilcraft.com</u>). Performance of the circuits with inductors from other manufacturers may vary.

#### 7.1.11 Adjustments and Controls External/Internal LO

An external LO may be applied at J6 but R96 should be moved to position R97 and the LMX2571 powered down.

# 7.2 Software Description

Please refer to the PE0003 User Manual for detailed description of the script handler software (see <u>www.cmlmicro.com</u> for more information). This is implemented on the on-board ARM microcontroller using the USB interface to a suitable PC running the ES9941A GUI. Section 7.3.1 gives detailed information about scripts developed for the DE9941A Evaluation kit.

# 7.3 Application Information

See section 4.1 for board setup details and section 4.2 for operating the DE9941A as a transmitter or receiver.

#### 7.3.1 GUI Description

On opening the script handler GUI (ES9941Axx.exe) the following conditions of the DE9941A are checked: the current firmware loaded on the board, CRC data and board information. The screenshot in Figure 5 shows a typical information dialogue box that is displayed to the user on start-up of the GUI.

About E	S9941A	×	
29	ES9941A Version EF0003 Version 1.0 Command Buffer Size: Data Buffer Size: File Buffer Size: 500 Firmware Version 1.0 Code: BB46CC92 Copyright (C) 2022	ОК	

Figure 5 DE9941A About Information Dialogue Screen

The script handler GUI software requires that the DE9941A is loaded with the script handler firmware (DE9941A-SCRIPT\_F02.xx.xx.bin). The latest version of the script handler firmware needs to be in the stored in the same directory as the script handler GUI executable. The GUI then does a comparison of any pre-loaded firmware with the version that resides in that same directory. If the firmware type matches but the version numbers do not then the GUI will automatically upload the newest version of firmware to the DE9941A, during this process a progress bar will be displayed. If the files match the GUI does nothing. If the firmware type does not match a warning message will be displayed as shown in Figure 6. In this case the firmware type on the board needs updating, to do this the user will need to use the DE9914A-LOAD-FLASH-GUI.exe which can be downloaded from the CML website along with the script handler firmware (DE9941A-SCRIPT\_F02.xx.xx.bin).

Figure 6 Warning Message when firmware versions don't match

The script handler GUI has a number of tabs as follows:

- C-BUS Control allows single register write and read commands to the selected device (device 1 only should be used).
- C-BUS Ctrl Ext 1 and 2 a set of register writes and reads can be configured, saved and recalled (device 1 only should be used).
- Function Image Load user can browse to the FI location and load the FI to device 1. If the "Read Three Words" is ticked the FI version number will be displayed correctly.
- Script Handler allows users to execute script files consisting of register write, read, and delay commands.
   Section 7.3.3 provides a description of some scripts provided to demonstrate the functionality of the DE9941A with FI-2 or FI-4.

#### 7.3.2 Function Image Load

Using the Function Image Load tab the latest FI firmware can be loaded. Figure 7 shows the GUI after a successful load of the FI.

#### 7.3.3 Scripts Handler Tab

Scripts can be executed using the "Script Handler" tab - browse to the relevant scripts and then press Run.

The following scripts are available to support the DE9941A using FI-4.x:

- DE9941A\_QAM\_Setup Must be run first on the Tx and Rx device
- DE9941A\_QAM\_Test\_RX- BER Script to be run first on the Rx
- DE9941A\_QAM\_Test\_TX- Only used with the Tx device

The following scripts are available to support the DE9941A using FI-2.x:

- DE9941A\_FSK\_Setup Must be run first on the Tx and Rx device
- DE9941A\_FSK\_Test\_RX- BER Script to be run first on the Rx
- DE9941A\_FSK\_Test\_TX- Only used with the Tx device

Note that the setup scripts are band specific because of different frequency of operation.

The scripts assume that the user has two DE9941As, one for Tx and one for Rx, although the setup script can be used to check the static performance of the Rx and Tx if required. A brief description of the function of each script is given in the following sections.

#### DE9941A\_QAM\_Setup

At the top of this script there is a section which allows the user to adjust some variables: these are baud rate, Rx channel BW, modulation type and channel No. The baud rate can be set to 9.6 k, 18 k, and 40 k. Other baud rates can be used but the script is optimised for use with these three baud rates. The receiver ACR bandwidth can be changed using the variable Rx\_BW. Valid values are 12 for 12. 5kHz system, 25 for 25kHz system and 50 for 50kHz system. The QAM modulation type can be set to 4, 16 and 64. The script includes a channel table which configures the LMX2571 over the entire operating range of 350.05 MHz to 399.55 MHz for the DE9941A-375 and 400.0625 MHz to 469.975 MHz for the DE9941A-435. The channel tables for the two board variants are shown in Table 3 and Table 4.

Frequency (MHz)	Channel No
351.25	1
353.5	2
355.95	3
361.05	4
363.5	5
365.95	6
350.05	7
366.5	8
383.5	9
399.55	10

#### Table 3 DE9941A-375 Channel Table (350 to 400MHz Operation)

#### Table 4 DE9941A-435 Channel Table (400 to 470MHz Operation)

Frequency (MHz)	Channel No
400.0625	1
435.0125	2
469.975	3
446.0125	4
446.05625	5
462.125	6
462.375	7
462.4	8
464.5	9
464.55	10
464.725	11
464.75	12

The script configures the CMX994E and CMX998. To ensure the best receiver performance is achieved it is necessary to train the Rx equaliser in the CMX7364; this has to be done with a good quality 4QAM or 4FSK input signal. The QAM setup script has pre-trained equaliser filter values for the following three cases; 9.6 ks/s using the minimum ACR filter setting (12.5kHz system), 18 ksymbols/s using the mid filter setting (25kHz system) and 40 ksymbols/s using the maximum filter setting (50kHz system). In the case of the FSK setup the script has pre-trained equaliser filter values for the following three cases: 4.8 ks/s using the minimum ACR filter setting (12.5kHz system), 9.6 ksymbols/s using the mid filter setting (25kHz system) and 19.2 ksymbols/s using the maximum filter setting (50kHz system). The trained equaliser filter will automatically be loaded depending on the Rx\_BW setting. The setup script performs a DC calibration of the CMX994E, the user is prompted to turn any input signal off while this is done so that the best result is achieved. The script log screen will tell the user what final value has been programmed into the extended DC offset register (\$17) of the CMX994E.

The setup script also sets up and executes a full DC calibration of the transmitter (CMX998). It also configures the high gain calibration condition for any subsequent DC calibrations performed on the transmitter.

The setup script also gives the user the ability to analyse the Rx performance typically described in section 4.2.2 and the Tx performance as described in section 4.2.1. See screen shots of the GUI in Figure 8 to Figure 12 which show the user prompts that occur during the execution of the QAM setup script.

Figure 12 Setup Script Log Screen after Script has completed

#### DE9941A\_QAM\_RX and DE9941A\_QAM\_TX

At the top of the scripts the user can select whether to test with raw or coded data (0 = raw/non-coded and 1 = coded) and how many bursts to do the test over.

Based on a back-to-back test the Rx script is run first and it will prompt the user if they want to enable AGC, see Figure 13. The Tx script is then run and the user will be prompted to choose the desired modulation type to be sent, this can be 4, 16, 32 or 64 QAM, see Figure 14 which shows a screenshot of the Tx script prompt.

Following successful reception and transmission the log screens shown in Figure 15 and Figure 16 can be observed. The results of the complete test are also written to a text file (ber\_results.txt) in the same directory as the scripts are stored; a screenshot of a typical txt file output is shown in Figure 17. From this the user can see confirmation of the test scenario alongside the reported EVM (signal quality), frequency offset, BE (bit errors per burst), A (AGC setting; 7 = max gain to 0 = min gain), RSSI (in dBm), IQ DC offsets and T (timer) per bursts plus the total errors.

# Figure 17 Typical ber\_results.txt file Output From the Rx

#### DE9941A\_FSK\_RX and DE9941A\_FSK\_TX

At the top of the scripts the user can select whether to test with raw or coded data (0 = raw/non-coded and 1 = coded) and how many bursts to do the test over.

Based on a back-to-back test the Rx script is run first and it will prompt the user to decide whether or not they want to enable AGC. The Tx script is then run, and the user will be prompted to choose the desired modulation type to be sent, this can be 4-, 8- or 16-FSK. Figure 13 and Figure 14 show typical screenshots of the Tx script prompt.

Following successful reception and transmission the log screens shown in Figure 15 and Figure 16 can be observed. The results of the complete test are also written to a text file (ber\_results.txt) in the same directory as the scripts are stored; a screenshot of a typical txt file output is shown in Figure 17. From this the user can see confirmation of the test scenario alongside the reported EVM (signal quality), frequency offset, BE (bit errors per burst), A (AGC setting; 7 = max gain to 0 = min gain), RSSI (in dBm), IQ DC offsets and T (timer) per bursts plus the total errors.

#### 7.3.4 Typical Receiver Results with CMX7364 FI-4

The Receiver Response Equaliser within the CMX7364 has been used in single mode to create a channel filter that has compensation for the ADCs and also the channel filtering within the Rx chain. The AAF (Anti-Alias filter in the CMX7364) is at its default setting of 50kHz, 3dB bandwidth. The ACR (Adjacent Channel Rejection) filters on the CMX994E are in the intermediate bandwidth state (typically 8kHz -3dB bandwidth).

In all of the following results the data rate is 18 ksymbols/s and, in the following table, the raw over-air bit rate for the three different modulation types have been highlighted. Also, the RRC channel filter used in all cases has an alpha of 0.2. Parametric measurements and graphs shown are typical only, not guaranteed performance limits.

QAM Modulation Type	Bits per Symbol	Base Over-air Bit Rate (18 ksymbols/s)	Raw Mode Over-air Bit Rate (18 ksymbols/s)
4-QAM	2	36,000 bps	32,000 bps
16-QAM	4	72,000 bps	64,000 bps
64-QAM	6	108,000 bps	96,000 bps

The difference between the base over-air rate and the raw mode rate (which is the actual user data rate in raw mode at 18 ksymbols/second) is due to some symbols being used internally by the modem to perform channel equalisation. All measurements reference ETSI EN 300 113 (v3.1.1 – June 2020) specification.

All of the detailed receiver performance results were taken with a CML PE0602-7364 and an IQ Vector Signal Generator as the wanted signal.

#### Sensitivity

Table 5 shows the EN 300 113 sensitivity specification limits; these limits are to be met at a BER of 10<sup>-2</sup>:

Channel BW	Data Rate	Sensitivity
	9.6 kbits/s or less	-110dBm
	More than 9.6 kbits to 38.4 kbit/s	limit shall be calculated as the linear interpolation
		between -105dBm and -98dBm
20kHz and 25kHz	38.4 kbits/s	-98dBm
	More than 38.4 kbits to 76.8 kbit/s	limit shall be calculated as the linear interpolation
		between -98dBm and -93dBm
	Greater than 76.8 kbit/s	-93dBm

#### Table 5 Sensitivity levels (mean power) for different gross (on-air) bit rates in a 25kHz channel

Sensitivity results for the DE9941A for 4-QAM, 16-QAM and 64-QAM are shown in Figure 18; the results were taken at 366.5MHz. It can be seen that there is significant margin on the EN 300 113 limits above.

<sup>© 2022</sup> CML Microsystems Plc

Figure 18 Rx Sensitivity with 4-QAM, 16-QAM and 64-QAM at 18 ksymbols/s

© 2022 CML Microsystems Plc

Figure 19 shows the 4-QAM sensitivity performance at the top, middle and bottom of the frequency range; channel 16, 8 and 1 respectively.

Figure 19 Rx Sensitivity at Different Frequencies with 4-QAM, 18 ksymbols/s

#### Adjacent Channel Rejection

The adjacent channel rejection was measured with the wanted signal at -102dBm (i.e. 3dB above the limited specified in Table 5) and the unwanted signal FM modulated (400Hz tone at +/- 3kHz deviation) at +/-25kHz offset. EN 300 113 states that a BER of less than  $10^{-2}$  should be achieved with an interferer level of -37dBm. The results in Table 6 show that this limit can be met with 4-QAM modulation, with ~4dB margin and the result is identical on the -25kHz offset.

Table 0 4-QAIVI KX AUJACETIL CHATTLET REJECTION WITH A FIVETILETETET AL T/-23KHZ OTIS	Table 6 4-QAM Rx Ad	jacent Channel Reje	ection with a FM Int	erferer at +/-25kHz Offs
---	---------------------	---------------------	----------------------	--------------------------

	+25kHz Offset	
Interferer Level (dBm)	BER	
-37	4.36E-05	
-36	6.21E-04	
-35	1.67E-03	
-34	2.91E-03	
-33	6.29E-03	
-32	1.31E-02	

The results in Table 7 show that this limit can be met with 16-QAM modulation, with ~4dB margin.

	+25kHz Offset
Interferer Level (dBm)	BER
-37	2.94E-04
-36	4.79E-04
-35	1.48E-03
-34	3.26E-03
-33	6.00E-03

#### Table 7 16-QAM Rx Adjacent Channel Rejection with FM Interferer at +/-25kHz offset

The results in Table 8 show that this limit can be met with 64-QAM modulation, with ~4dB margin.

	+25kHz Offset	
Interferer Level (dBm)	BER	
-37	1.58E-03	
-36	2.43E-03	
-35	4.50E-03	
-34	6.49E-03	
-33	1.14E-02	

# Table 8 64-QAM Rx Adjacent Channel Rejection with a FM Interferer at +/-25kHz offset

#### **Co-Channel Rejection**

The co-channel rejection was measured with the wanted signal 3dB above the limit specified in Table 5 and the unwanted signal FM modulated (400Hz tone +/- 3kHz deviation) on frequency.

EN 300 113 co-channel specification limits are as follows and these limits are to be met at a BER of 10<sup>-2</sup>:

Channel BW	nnel BW Data Rate	
	9,6 kbit/s or less	-8dB
25kHz	More than 9,6 kbits to 38,4 kbit/s	-12dB
	More than 38,4 kbits to 76,8 kbits	-19dB
	Greater than 76,8 kbit/s	-24dB

#### Table 9 Co-channel Performance for different gross (on-air) bit rates

The results for 4-QAM, 16-QAM and 64-QAM co-channel performance are shown in Figure 20. It can be seen that the EN 300 113 can be met in all cases with more than 3dB margin.

Figure 20 4-QAM, 16-QAM and 64-QAM Co-Channel Performance

#### Intermodulation

Intermodulation was measured against EN 300 113, which specifies that the wanted tone is 3dB above the limit specified in Table 5 and the spacing between the unwanted tones is 50kHz. The first unwanted tone was at +/-50kHz offset from wanted and was un-modulated. The second unwanted tone was at +/-100kHz offset and was FM modulated with a 400Hz tone at +/-3kHz deviation. The EN 300 113 limit is at an unwanted tone level of -42dBm for handportable and mobile stations at a BER of less than  $10^{-2}$ . The results for 4-QAM are given in Table 10: they show the EN 300 113 can be met comfortably. In normal IP3 mode the EN 300 113 requirement for hand portable and mobile stations can still be met with ~1 to 2dB margin.

$rapic 10$ in intermodulation remainder of $-\alpha$ in intermediation of $-\alpha$
---

Interferer Level (dBm)	BER	Separation (dB)
-40	2.40E-04	62
-39	1.00E-03	63
-38	2.77E-03	64
-37	8.56E-03	65
-36.5	1.40E-02	65.5

#### Blocking and Spurious Response Rejection

The wanted 4-QAM signal level was -102dBm and an interferer was generated by the SMW200A Low Noise Signal Generator, which was FM modulated for the spurious response tests or unmodulated for the blocking tests. The EN 300 113 spurious response interferer level limit is -37dBm with the wanted signal 3dB up from the sensitivity level in Table 5, the BER must be less than  $10^{-2}$ . The EN 300 113 blocking requirement is to have a BER less than  $10^{-2}$  at an interferer level of -23dBm. The results show that in the 4-QAM mode, the EN 300 113 limits are met comfortably.

Offset of Interferer (Hz)	Interferer Level (dBm)	BER	Comment
50k	-33		Modulated
75k	-33.5		Modulated
100k	-33.5		Modulated
125k	-33.5		Modulated
150k	-33		Modulated
500k	-23		Modulated
1M	-15		Modulated or Unmodulated
-180.525M	-33		Modulated. The 2 <sup>nd</sup> harmonic of the interferer must be less than -115dBm to ensure it doesn't act like a co-channel signal
361.05M	0		Modulated
2M	-12		Unmodulated
5M	-9		Unmodulated
10M	-9		Unmodulated

Table 11 4-QAM Rx Spurious Response and Blocking Performance

#### **Rx Conducted Spurious**

All spurious are below -80dBm up to 1GHz.

#### High Input Level Performance

With AGC ON in the CMX7364, the receiver can be seen to work up to 0dBm with 4-QAM modulation.

#### 7.3.5 Typical Transmit Performance with CMX7364 FI-4

The signal spectrum is identical in bandwidth when using 4-, 16- or 64-QAM. However, the peak-to-mean of each modulation type does vary.

4-QAM has a peak to mean of	5.2dB (α=0.2) or 3.8dB (α=0.35)
16-QAM has a peak to mean of	6.8dB (α=0.2) or 5.8dB (α=0.35)
64-QAM has a peak to mean of	7.3dB (α=0.2) or 6.3dB (α=0.35)

Table 12 shows some typical measurements at 366.5MHz, with the different QAM and channel filter types at 18 ksymbols/s. Parametric measurements and graphs shown are typical only, not guaranteed performance limits.

Some further detailed results have been taken with 16-QAM modulation at 18ksymbols/s, with a RRC alpha = 0.2. These results are shown in the following sections.

<sup>© 2022</sup> CML Microsystems Plc

#### 16-QAM ACP

The plot in Figure 21 was taken at 350.05MHz, Figure 22 is at 366.5MHz and Figure 23 is at 399.55MHz with a baud rate of 18 ksymbols/s. In all cases the mean output power is >+23dBm. Note that this includes ~1.2dB loss through the Tx/Rx switch, harmonic filter/coupler. The peak to mean of 16-QAM is ~6.8dB, based on a RRC alpha = 0.2 channel filter. A summary of results is shown in Table 13. There are also plots of 16-QAM at different baud rates, the plot in Figure 24 is with a baud rate of 9.6 ks/s and the plot in Figure 25 is with a baud rate of 40 ks/s.

#### Transmit Harmonics and Spurious

The following pairs of plots show the DE9941A Tx output at the low (350.05MHz), mid (366.5MHz) and upper (399.55MHz) points of the operating frequency. At each frequency, the plots are taken with a wide span. In all cases the main spurious is the 2<sup>nd</sup> harmonic.

#### 7.3.6 Typical Receiver Results with CMX7364 FI-2

The Receiver Response Equaliser within the CMX7364 has been used in single mode to create a channel filter that has compensation for the ADCs and the channel filtering within the Rx chain. The AAF (Anti-Alias filter in the CMX7364) is at its default setting of 50kHz, 3dB bandwidth. The ACR (Adjacent Channel Rejection) filters on the CMX994E are in the minimum bandwidth state (typically 4kHz -3dB bandwidth).

In all the following results the data rate is 4.8 ksymbols/s (9.6 kbps). The RRC channel filter used in all cases has an alpha of 0.2. Parametric measurements and graphs shown are typical only, not guaranteed performance limits. All measurements reference ETSI EN 300 113 (v3.1.1 – June 2020) specification.

All the detailed receiver performance results were taken with a CML PE0602-7364 and an IQ Vector Signal Generator as the wanted signal.

#### Sensitivity

Table 5 shows the EN 300 113 sensitivity specification limits; these limits are to be met at a BER of 10<sup>-2</sup>:

Channel BW	Data Rate	Sensitivity				
	9.6 kbits/s or less	-110dBm				
	More than 9.6 kbits to 16 kbit/s	limit shall be calculated as the linear interpolation				
		between -105dBm and -98dBm				
	16 kbits/s	-98dBm				
12.5KHZ	More than 16 kbits to 38.4 kbit/s	limit shall be calculated as the linear interpolation				
		between -98dBm and -93dBm				
	38.4 kbits/s	-93dBm				
	Greater than 38.4 kbit/s	-93dBm				

Table 14 Sensitivity Levels (mean power) for Different Gross (on-air) Bit Rates in a 12.5kHz Channel

Sensitivity results for the DE9941A-435 for 4-FSK, 8-FSK and 16-FSK are shown in Figure 36; the results were taken at 446.05625MHz with baud rate set to 4.8 ks/s (4-FSK = 9.6kb/s, 8-FSK = 14.kb/s and 16-FSK = 19.2 kb/s). It can be seen that there is significant margin on the EN 300 113 limits above.

The plot in Figure 37 shows the Rx sensitivity in different channel bandwidths at 446.05625MHz where 4.8k s/s = 12.5kHz system, 9.6 ks/s = 25kHz system and 19.2 ks/s = 50kHz system (sensitivity levels for 25kHz system can be found in Table 5.

Figure 36 DE9941A-435 Rx Sensitivity with 4-FSK, 8-FSK and 16-FSK at 4.8 ksymbols/s

Figure 37 DE9941A-435 Rx Sensitivity at Different baud rate/Channel Bandwidths

Figure 38 shows the 4-FSK sensitivity performance at the top, middle and bottom of the frequency range; channel 3, 2 and 1 respectively. The plot also includes channel number 5 - 446.05625MHz.

Figure 38 DE9941A-435 Rx Sensitivity at Different Frequencies with 4-FSK, 4.8 ksymbols/s

#### Adjacent Channel Rejection and Spurious Responses

The typical LO phase noise requirements for a 4FSK, 12.5kHz system to meet EN 300 113 Receiver adjacent channel and spurious responses are as follows:

Parameter	ACS (12.5kHz offset)	Spurious Response (25kHz offset and above)	Blocking (1MHz offset and above)
Rejection	-60dB	-70dB	-84dB
Noise BW of 8.5kHz	-39.3dB	-39.3dB	-39.3dB
Target S/N ratio <sup>1</sup>	-9 / -10dB	-9 / -10dB	-9 / -10dB
Noise Floor	-108.3 / -109.3dBc/Hz	-118.3 / -119.3dB/Hz	-132.3 / -133.3dBc/Hz
PN at offset + 3dB Margin	-111.3 / -112.3dBc/Hz	-121.3 / -122.3dBc/Hz	-135.3 /-136.3dBc/Hz
PN at x2 LO +3dB Margin	-105.3 / -106.3dBc/Hz	-115.3 / -116.3dBc/Hz	-129.3/ -130.6dBc/Hz

Table 15 Rx LO Phase Noise Requirement to Meet EN 300 113

From Table 15 it can be seen that the spurious response requirement is the most difficult parameter to meet. To give 3dB margin over the 70dB requirement it is necessary to have phase noise performance of  $\sim$  -122.3dBc/Hz at 25kHz offsets and above, with the region around the PLL loop bandwidth, where the noise can peak, being the worst case (circa +/-100kHz offset).

The adjacent channel rejection at 12.5kHz offset was measured with the wanted signal at -107dBm (i.e. 3dB above the limited specified in Table 14) and the unwanted signal FM modulated (400Hz tone at +/- 1.5kHz deviation) at +/-12.5kHz offset. EN 300 113 states that a BER of less than  $10^{-2}$  should be achieved with an interferer level of -47dBm. The results in Table 16 show that this limit can be met with 4-FSK, 4.8ks/s modulation, with >10dB margin and the result is identical on the -12.5kHz offset.

<sup>&</sup>lt;sup>1</sup> The EN 300 113 specification for Rx co-channel performance is 12dB, the value used of 9/10dB represents a practical amount of margin that is achievable for this requirement.

	+12.5kHz Offset
Interferer Level (dBm)	BER
-40	3.81E-04
-38	2.60E-03
-37	6.64E-03
-36.5	9.84E-03
-36	1.39E-02

#### Table 16 4-FSK Rx Adjacent Channel Rejection with a FM Interferer at +/-12.5kHz Offset

The results in Table 17 show results for some typical spurious responses, the EN 300 113 requirement is that at any frequency separated from the nominal frequency by two channels or more shall produce a BER of <1e-2 at an interferer level of -37dBm. The wanted 4-FSK signal level was -107dBm and an interferer was generated by the SMW200A Low Noise Signal Generator, which was FM modulated for the spurious response tests or unmodulated for the blocking tests. The EN 300 113 blocking requirement is tested with an unmodulated interferer and the level of the interferer shall not be less than -23dBm.

The results show that in the 4-FSK mode, the EN 300 113 limits are met but not with much margin, particularly at 250kHz offset where there is a slight peaking in the phase noise at the loop bandwidth and because the loop bandwidth had to be wider the noise at the 1MHz offset is marginal. The limiting factor here is the phase noise performance of the LO which is produced by the LMX2571 on the DE9941A design. To achieve better margin on these key parameters CML recommends that the CMX940 is used which has better phase noise performance compared to the LMX2571.

Offset of Interferer (Hz)	Interferer Level (dBm)	Comment		
25k	-36	2 <sup>nd</sup> Adjacent, modulated		
50k	-36	Modulated		
75k	-36	Modulated		
100k	-36	Modulated

500k	-31	Modulated		
1M	-23	Unmodulated		
-223.028125M	-34.5	Modulated. The 2 <sup>nd</sup> harmonic of the interferer must be less than -117dBm to ensure that it doesn't behave like a co- channel signal		
446.05625M	-3	Modulated		
2M	-17	Unmodulated		
5M	-13	Unmodulated		
10M	-12	Unmodulated		

Table 17 4-FSK Rx Spurious Response and Blocking Performance

#### **Co-Channel Rejection**

The co-channel rejection was measured with the wanted signal 3dB above the limit specified in Table 14 and the unwanted signal FM modulated (400Hz tone +/- 1.5kHz deviation) on frequency.

EN 300 113 co-channel specification limits are as follows and these limits are to be met at a BER of 10<sup>-2</sup>:

#### Table 18 Co-channel Performance for Different Gross (on-air) bit rates

Channel BW	Data Rate	Co-channel
12.5kHz	9,6 kbit/s or less	-12dB

The co-channel rejection was measured as -9dB for 4-FSK, 4.8ks/s. This comfortably meets the EN 300 113 requirement.

#### Intermodulation

Intermodulation was measured against EN 300 113, which specifies that the wanted tone is 3dB above the limit specified in Table 14 and the spacing between the unwanted tones is 50kHz. The first unwanted tone was at +/-50kHz offset from wanted and was unmodulated. The second unwanted tone was at +/-100kHz offset and was FM modulated with a 400Hz tone at +/-1.5kHz deviation. The EN 300 113 limit is at an unwanted tone level of -42dBm for hand-portable and mobile stations at a BER of less than 10<sup>-2</sup>. The results for 4-FSK, 4.8ks/s are given in Table 19, the test is done with the wanted at -107dBm: they show the EN 300 113 hand-portable requirement can be met with ~2 to 3dB margin.

#### Table 19 Rx Intermodulation Performance for 4-FSK in Enhanced IP3 Mode

Interferer Level (dBm)	BER	Separation (dB)
-42	4.79E-4	65
-40	4.74E-3	67
-39	1.28E-3	68

# **Rx Conducted Spurious**

All spurious are below -80dBm up to 1GHz.

# High Input Level Performance

With AGC ON in the CMX7364, the receiver can be seen to work up to 0dBm with FSK modulation.

# 7.4 Troubleshooting

The DE9941A is a complex RF and baseband system. If incorrectly programmed or modified, results will be at variance from datasheet performance. Please study the CMX7364, CMX998 and CMX994E datasheets, along with the manuals and the associated schematics and layout drawings for these and the DE9941A PCB carefully when troubleshooting. This section provides suggestions to help users resolve application issues they might encounter.

# 7.4.1 Receiver Operation

Error Observed	Possible Cause	Remedy		
Received data is not provided by the receiver	Incorrect set-up	Ensure that suitable values are written to the CMX7364 registers concerning receiver gains and polarity. Also check the dc offsets and signal levels into the CMX7364 IQ Inputs (TP15, 16, 18 and 19).		
	Incorrect set-up	The CMX994E has not been programmed correctly. Check signals as above.		
	FI not loaded	Reset by cycling power. Check checksums.		
Synthesiser not locked	Incorrect configuration components	Check the LMX2571 synthesiser programming data is correct.		
Poor Receiver Performance	Receiver Response Equaliser configuration	Ensure single mode equaliser is being used and that training is done with a signal level of ~-65dBm.		
	CMX994 DC Offset register not optimal	Check DC offset between I+ & I- and Q+ & Q- to be less than 15mV with nominal Rx settings, maximum Rx gain and no RF signal applied.		

#### Table 20 Receiver - Possible Errors

# 7.4.2 Transmitter Operation

Error Observed	Possible Cause	Remedy
Synthesiser not locked	Incorrect configuration components	Check that the LMX2571 synthesiser programming data is correct.
Boor Ty modulation spectrum	Modulation levels incorrect	Check CMX7364 main DAC attenuator values (B4 and B5) are correct for the modulation and Channel Filter type.
Poor 1x modulation spectrum	Poor DC Calibration	Check nulled carrier condition, i.e. no modulation case. The nulled carrier should typically be <-25dBm.
Poor Wideband Spectrum	Incorrect CMX998 Loop Phase Setting	Check values sent to the CMX998 Phase control register.
Low power	PIN diode or PA not enabled	Check that the TXEN+V (TL4) power supply is enabled. Also check that the RAMDAC output is being enabled. Check PA control volts at TP23 are ~2.6/2.7V dc.

#### Table 21 Transmitter - Possible Errors

© 2022 CML Microsystems Plc

# 8 Performance Specification

# 8.1 Electrical Performance

# 8.1.1 Absolute Maximum Ratings

Exceeding these maximum ratings can result in damage to the Evaluation Kit.

	Min.	Max.	Units	
Supply (V <sub>IN</sub> - V <sub>SS</sub> )	0	4.5	V	
Current into or out of $V_{IN}$ and $V_{SS}$ pins	0	+1.5	А	
Current into or out of any other connector pin	-20	+20	mA	
Receiver Maximum Input Level		+10	dBm	

# 8.1.2 Operating Limits

Correct operation of the Evaluation Kit outside these limits is not implied.

	Notes	Min.	Max.	Units
Supply (V <sub>IN</sub> - V <sub>SS</sub> )		3.5	4.5	V

# 8.1.3 Operating Characteristics

For the following conditions unless otherwise specified:

#### 6.5.2.1 QAM Performance

Xtal Frequency = 38.4MHz, Bit Rate = 18ksymbols/s, Noise Bandwidth = 16kHz, V<sub>IN</sub> = 4.5V, T<sub>AMB</sub> =  $+25^{\circ}$ C.

	Notes	Min.	Тур.	Max.	Units
DC Parameters					
I <sub>IN</sub> (on power-up)	1	-	58	68	mA
I <sub>IN</sub> (FI Loaded only)	1	-	55	58	mA
I <sub>IN</sub> (Rx enabled)		-	165	-	mA
I <sub>IN</sub> (Rx enabled and SFS)		-	225	_	mA
I <sub>IN</sub> (Rx enabled and Rx Data)		-	210	-	mA
I <sub>IN</sub> (Tx and PA enabled, nulled carrier)		-	365	-	mA
$I_{\mbox{IN}}$ (Tx and PA enabled, modulated carrier)		-	900	1500	mA
AC Parameters					
Frequency Range		350.00	_	400.00	MHz
Тх					
Mean Output Power	2,3	-	25	_	dBm
Tx Output Impedance		-	50	-	Ω
Adjacent Channel Power					
16-QAM 1 <sup>st</sup> ACP	2,3	-	66	-	dBc
16-QAM 2 <sup>nd</sup> ACP	2,3	-	75	-	dBc
Tx EVM	2	-	1	_	%
Unwanted emission	4	-	-36	-	dBm
Frequency Error		-	1.5	-	ppm
Rx					
Rx Input Impedance		-	50	-	Ω
Rx Sensitivity	4,5				
4-QAM		-	-116	-	dBm
16-QAM		-	-110	-	dBm
64-QAM		-	-104	-	dBm
Adjacent Channel Rejection (4-QAM)	4	-	-34	-	dBm
Spurious Response (4-QAM, worst case)	4	-	-34	-	dBm
Co-Channel Rejection (4-QAM)	4	-	8	-	dB
Intermodulation, enhanced mode (4-QAM)	4	_	-37	-	dBm
Rx Conducted Spurious	4	-	< -80	-	dB
Maximum Input Level		-	0	-	dBm

#### **Microcontroller Interface**

For timings see CMX7364 Datasheet

# Notes:

1. PCB current consumption, not current consumption of the CML devices.

- 2. Modulation 4-QAM and RRC alpha = 0.2.
- 3. 25kHz Channel Spacing and 18kHz Measurement Bandwidth
- 4. Tested as specified in EN 300 113. BER (Bit Error Rate), where applicable, is 1 x 10<sup>-2</sup> in all cases in normal mode.

5. Tx/Rx Channel Filter RRC alpha = 0.2. Receiver Response Equaliser used in single mode.
